Abstract: Startups operate in highly uncertain and rapidly changing environments where limited financial resources, changing customer needs, technological uncertainty, and strong market competition create significant project management challenges. In such conditions, traditional project management approaches may not always provide sufficient flexibility for innovative projects. Innovative approaches such as Agile, Lean Startup, Design Thinking, and hybrid project management provide startups with practical mechanisms for experimentation, customer feedback, rapid adaptation, and efficient resource utilization. This article examines the role of innovative project management approaches in startup development and identifies key methods that can support the transformation of innovative ideas into sustainable products and services. Particular attention is given to iterative development, Minimum Viable Products, customer validation, continuous improvement, cross-functional teamwork, and data-driven decision-making.

Keywords: startups, innovation, project management, Agile, Lean Startup, Design Thinking, hybrid management, innovation projects, entrepreneurship, Minimum Viable Product.

Introduction. Startups have become an important component of modern innovation ecosystems. Unlike traditional enterprises, startups frequently develop products and services under conditions of high uncertainty. They often have limited financial and human resources while simultaneously facing changing customer expectations, technological developments, and strong competitive pressure. Therefore, effective project management is particularly important for transforming an innovative idea into a commercially viable product.Traditional project management approaches generally emphasize detailed planning, predefined requirements, sequential implementation, and formal control mechanisms. Such characteristics can be useful when project requirements are relatively stable. However, startup projects often require continuous experimentation and modification because the final product, target customer, and business model may change during development.Recent research emphasizes the importance of Agile and Lean Startup approaches for innovative entrepreneurial projects. Studies indicate that Lean Startup methods can support business model innovation through experimentation, customer development ,and iterative learning.Consequently, startup project management increasingly requirs approaches that combine planning discipline with flexibility. The objective of this article is to examine innovative project management approaches applicable to startups and to identify mechanisms that can improve the management of innovation-oriented projects.The Lean Startup approach focuses on reducing uncertainty through experimentation and validated learning. One of its central concepts is the Minimum Viable Product (MVP). Instead of investing substantial resources in a fully developed product before testing market demand, a startup develops a simplified version that can be tested with potential customers.The basic cycle can be represented as:

Build → Measure → Learn → Improve The startup develops an MVP, measures customer reactions and performance indicators, learns from the collected information, and subsequently improves or changes the product.Research on Lean Startup approaches identifies Business Model Canvas, Customer Development, and Agile Development as important components of this approach. Lean Startup can therefore help entrepreneurs answer three fundamental questions:

1. What problem does the customer have?
2. Does the proposed product solve this problem?
3. Are customers willing to use or pay for the proposed solution?

Design Thinking is a human-centered approach to innovation. It places the needs, experiences, and problems of users at the center of the innovation process.A typical Design Thinking process includes:
Empathize → Define → Ideate → Prototype → Test
For startups, Design Thinking can support the identification of previously unrecognized customer problems. Prototypes can be developed and tested before significant resources are committed to full-scale production.The approach is particularly relevant to projects where the problem itself is not clearly defined at the beginning.A hybrid approach combines elements of traditional project management with Agile and Lean methods. This approach can be particularly relevant for startups that need both flexibility and formal control.For example, strategic objectives, budgets, deadlines, and regulatory requirements can be managed using traditional planning mechanisms, while product development can be conducted through Agile iterations and customer validation.Research on innovation program management has proposed hybrid models combining traditional project-management structures with Agile adaptability and Lean waste reduction.Based on the reviewed approaches, an integrated startup project management model can be represented as:

Problem Identification
↓Design Thinking
↓Business Model Canvas
↓MVP Development
↓Agile Testing
↓Customer Feedback
↓Measure & Analyze
↓Improve / Pivot
↓Market Validation
↓Scaling

This model combines the human-centered orientation of Design Thinking, the business-model perspective of Business Model Canvas, the experimental logic of Lean Startup, and the iterative development principles of Agile.Such integration is consistent with research suggesting that Lean Startup, Agile, and customer-development methods can work together in business model innovation.

Results and Discussion.The analysis demonstrates that startup innovation projects require a different management logic from projects with stable requirements. The primary management objective is not simply to complete predetermined tasks but also to generate knowledge about the market, customer, technology, and business model.

Agile contributes flexibility and iterative development. Lean Startup contributes experimentation and validated learning. Design Thinking contributes customer-centered problem solving. Hybrid management provides a mechanism for combining flexibility with formal planning and control.

An important implication is that startups should avoid applying a methodology mechanically. The appropriate combination of tools should depend on the project's technological complexity, market uncertainty, available resources, team competencies, and regulatory environment.

A 2025 systematic review found that managerial experimental approaches—including Lean Startup, Agile, Design Thinking, and Growth Hacking—are increasingly discussed as mechanisms for innovation, experimentation, adaptation, and business-model development.Therefore, the effectiveness of startup project management can be associated with the ability to create a balance between innovation, speed, customer orientation, resource efficiency, and strategic control.

Conclusion.Innovative project management is an important factor in the development and sustainability of startups. High uncertainty, limited resources, rapidly changing technologies, and evolving customer expectations require flexible management mechanisms. Agile, Lean Startup, Design Thinking, Business Model Canvas, and hybrid project management provide different tools for addressing these challenges. Agile supports iterative development and responsiveness; Lean Startup emphasizes experimentation and validated learning; Design Thinking focuses on customer needs; while hybrid approaches combine flexibility with structured planning.

An integrated model based on Design Thinking → Business Model Canvas → MVP → Agile Development → Customer Feedback → Measurement → Iteration → Scaling can provide a practical framework for managing innovation-oriented startup projects.The central principle is that startup project management should not be limited to controlling time, cost, and scope. It should also facilitate continuous learning, experimentation, customer involvement, innovation, and adaptation. Consequently, innovative project management approaches can serve as an important managerial foundation for transforming uncertain startup ideas into sustainable products and services.
